Change the Oil in Your Vehicle

What most of us think of as “normal” driving includes everyday short trips (less than 10 miles), stop-and-go city traffic driving in dusty conditions, and at sustained highway speeds during hot weather. As you continue to operate your car under these normal driving conditions, the oil in your engine becomes used and eventually needs to be changed.

For maximum protection, most oil companies suggest changing the oil every 3,000 miles or three to six months regardless of what type of driving you do.

If oil is not changed regularly, the oil becomes dirty and thickens. Eventually, the oil won't be able to drain back down through the engine into the oil pan. The oil then builds up in the valve covers, which means there is less oil in the oil pan. Once they become plugged, the bottom of the engine “runs out” of oil since the oil can't get back down into the bottom. As a result, the bearings in the engine will seize and the engine will stop running.

Therefore, if the oil isn't changed often enough, your vehicle can end up with accelerated wear and all the problems that come with it:

- Loss of performance
- Loss of fuel economy
- Increased emissions
- Increased oil consumption

Money:

Environment:

Time:

Comfort:

The loss of performance and fuel economy directly translates to losing hard earned money. If the oil in your car is not changed regularly, it can have disastrous effects on your car and your wallet.

To ensure that your engine doesn't encounter these problems, stop by the VW Springfield Center Service Department to have your oil checked.
