Rotate Your Tires

Tires do a lot of work. With each turn of the steering wheel, pressure is brought on your car's front tires. Furthermore, resistance (where the "rubber meets the road") causes friction, which produces heat. As a result—depending on whether your vehicle is front-wheel drive or rear-wheel-drive—one pair of tires wears more quickly than the other.

Because of this, it's necessary to rotate the tires front-to-rear several times during their life cycle in order to equalize tread wear and maximize the life of the tires. Tire rotation is an important maintenance duty that extends the life of your tires, ensures safe driving, and saves you money.

How often should you have your tires rotated? Refer to your owner's manual for specific guidelines, but most manufacturers recommend rotating tires approximately every 5,000 to 10,000 miles. To have your tires checked, come to the Discount Service Center Service Department to ensure that your tires are performing at their best.
