## Keep Your Spark Plugs Sparking

Spark plugs provide the spark that burns fuel. The spark will ignite, combust or explode a flammable liquid such as gasoline, and create a pressure that drives the piston downward.

Spark plugs come in two basic types: cold and hot. Cold plugs operate best in high-horsepower, high-compression engines and have less insulation, so more heat can be transferred away from the combustion chamber to the outside of the engine. If the plug isn't cold enough for a particular job, it can't get enough heat out of the piston chamber. This can lead to pre-ignition, knocking, and permanent engine damage. On the other hand, hot plugs have more insulation and can be found in most standard engines. The extra

insulation maintains the plug's temperature high enough to burn off carbon deposits, which allows for more time between spark plug changes.

It is recommended that spark plugs be changed every 30,000 miles, and checked at least twice a year. By regularly checking your spark plugs, you will be able to keep the cost of fuel down and also get better gas mileage.

Stretch your dollar by having the Discount Service Center check or replace your spark plugs for you.

**15% OFF** Regularly Scheduled Maintenance

**FREE** 29-Point Inspection
