Windshield Wiper Fluid

A clean windshield can be very important in terms of your safety. If you can't see through your windshield, you most likely won't be able to drive very well, if at all. Windshield washer fluid is a fluid for cars that is used in cleaning the windshield while the vehicle is in use. A switch inside the car can be operated to squirt fluid onto the windshield typically using an electrical pump using jets mounted either beneath the windshield or beneath the wiper blades. The windshield wipers are then turned on, cleaning dirt and debris off the windshield. Some cars use the same method to also clean the rear window and thus, may have several fluid reservoirs.

Good washer fluid will break the bond between the windshield glass and the contaminants or minerals. Washer fluid also washes the windshield and also protects the rubber blades on the wipers. It also helps dissolve ice crystals that form on the windshield in cold weather. The wiper blades are also protected by washer fluid from getting hard and scratching the windshield.
